

# KmerGenie report

**Predicted best k: 61**

**Predicted assembly size: 1903304894 bp**

The above plot should be roughly concave and have a clear global maximum. If not, the predicted best k is likely to be inaccurate.

[Click here for more details.](#)

**Sampled histogram and fit for each value of k**

Colors of the fits: red is the fit of the complete statistical model of the histogram (erronous k-mers + genomic k-mers). When using the diploid model, green are only the heterozygous k-mers, green are only the homozygous k-mers.
